Submission on draft determination, QCA solar feed-in tariff review 2026-27

Date: 30 April 2026

After reading the Solar-Feed-in-Tariff-draft-determination-fact-sheet-2026-27, I am very confused why the wholesale energy cost would come into the calculation for the FIT. If this calculation is used every time the FiT is calculated, eventually we will not be getting anything for the FiT. Considering the energy provider does not pay upkeep for their customers solar panels, I find the wholesale energy cost being used in this calculation, useless and a money grab.

As the "Other Energy Costs" are not outlined in this document, I can only assume this is the cost for the physical wires and associated physical equipment used for power distribution, which we are already paying in our "Daily Supply Charge" on our tariffs. Why do we have to pay yet again for something that we have already paid for?

To summarise, I find the calculation used for the FiT flawed and not fit for purpose for this type of calculation. The FiT should be calculated on how much it cost the individual customers to install and upkeep the solar panels. After all, we are the ones helping the energy supplier, not the other way around. If they don't update their equipment to keep pace, that's not our fault.
